Prospective Cohort Study Evaluating a **Centralised Virtual Limb Salvage (CVLS) Clinic** for the Management of Complex Chronic Limb Threatening Ischemia

About this study

This study is investigating whether a Centralised Virtual Limb Salvage (CVLS) Clinic can improve outcomes for patients with complex chronic limb threatening ischemia (CLTI), a serious condition where reduced blood flow puts limbs at risk of amputation.

The CVLS Clinic brings together specialist vascular experts via a regular virtual platform to review and manage complex cases and advise on treatments as per standard of care.

Who can participate?

- Age over 18 years
- Patients with a new or non-healing wound on the foot or leg
- Patients with lower limb chronic limb threatening ischemia
- Patients with PAD
- Patients with Diabetes Mellitus
- Patients with multiple failed attempts at revascularisation and CLTI

What does participation involve?

- MDT review: Participant case will be reviewed by a specialist virtual MDT clinic and advice on best treatment options will be considered
- Data collection: Clinical information will be collected from medical records and stored in confidential study database
- Follow-up: Regular follow-up to monitor outcomes over time
